Abstract

Making parentheses mistakes in the authority of scientific names of fish is quite frequent. To determine this kind of errors, titles in Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book and abstracts in ASFA (Aquatic Sciences and Fisheries Abstracts) in year of 1998 were studied. Both datasets gave unexpectedly high percentages of authority errors. For some species, the error percentages were up to 96%. Logically, omitting parentheses was more common than adding them. These statistics should be taken into account in the authority of scientific names. To prevent these kinds of mistakes, some recent references and websites should be taken into consideration before using authority of fish.

Key Words: Authorship, error, nomenclature, parentheses.

Introduction

In respect to the International Code of Zoological Nomenclature (International Commission on Zoological Nomenclature, 1985), the inclusion of the authors of scientific names is optional and when the original specific name is now joined to another genus the authority of scientific names of species must be written in parentheses. The date may be omitted, but if given, should be separated from the author by a comma; *Cyprinus rutilus* Linneaus, 1758. If the species was originally described in another genus this is indicated by placing author and date in parenthesis *Rutilus rutilus* (Linneaus, 1758). It is strongly recommended that the date of publication and the authorship of a name be cited at least once in the work, which deals with a taxon. This is particularly important for species-group epithets. Specifying the author and date prevents confusion if the same specific name has been used twice to refer to different species in the same genus. For example, *Conus abbreviatus* Reeve, 1843 is a valid species, but *Conus abbreviatus* Dautzenberg, 1937 is a variety of *Conus textile*. Quoting scientific name, author name and common name together is generally more common than other forms of quoting although it is separately determined by the rules of each journal. The practice of quoting only the common name, probably more limited to articles on physiology or fundamental biology due to it is inconvenient for identification of the paper in the database by potentially interested readers. The name of well-known biologists (called the authority) can be abbreviated. For instance, usage of L. instead of Linnaeus is very often and this practice mostly depends on publisher's demand. Nevertheless, using parentheses in the authority of specific name is quite

often overlooked or misused. For example, some authors wrongly quote *Onchorhynchus mykiss*, Walbaum, 1792 while some of the others correctly quote *Onchorhynchus mykiss* (Walbaum, 1792).

The aim of this study was to quantify the common errors in the authority of scientific names of fish. Percentage of wrongly used scientific names of fish and their correct forms that are cited in various datasets are presented.

To conduct this study, we selected two main databases. One of them was Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book (Timur *et al.*, 2003), which has 842 papers with author name published by Turkish investigators between 1926 and 2003 years. The other one was ASFA (Aquatic Sciences and Fisheries Abstracts), which has 1029 papers with author name in year of 1998 for a general view. We used Wheeler (1992), Catalog of Fishes (Eschmeyer, 1998) that is also available as a web page (<http://www.calacademy.org/research/ichthyology/catalog>) and the web page of <http://www.fishbase.org> as good references to confirm correct authority of scientific names of fish.

In Tables 1 and 2, the number of papers with incorrect and correct authors and their percentages for fish species with author in the papers titled in Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book and abstracted in ASFA (Aquatic Sciences and Fisheries Abstracts) of 1998 were denoted. The inclusion of author is quite often wrong. All datasets revealed unforeseen high percentages of errors for searched literature. For Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book the number of papers wrong and correct used in the authority of scientific names was, 402 and 440 respectively, while corresponding numbers were 243 and 786, respectively for ASFA of 1998. Papers in titled in

Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book gave two times higher percentage of authority errors (48%) than papers abstracted in ASFA of 1998 (24%). When only papers that included the authority above at least ten times, in the Table 1 and 2 were considered, up to 96% were wrong for some fish species. In the both datasets, there were some extraordinary results. For instance; In the Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book, among papers on *Dicentrarchus labrax* and *Engraulis encrasicolus*, 2 citations were correct and 40 and 19 citations were wrong, respectively, while in the ASFA of 1998, among papers on *Dicentrarchus labrax* 1 citation was correct and 25 citations were wrong. Finally, among papers on *Cyprinus carpio* in ASFA of 1998, 53 citations were correct and 1 citation was wrong. Error of omitting the parentheses was more common than adding them. In the ASFA abstracted papers of 1998, numbers for error of omission and addition of parentheses were 202 and 41, respectively. In the Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book, equivalent figures were 362 and 40, respectively.

These statistics should be taken into account (in the authority of specific names of fish) by authors, reviewers, and editorial boards to check for these kinds of errors on manuscripts more carefully. To prevent these kinds of mistakes, some recent references and websites should be taken into consideration before using authority of fish.

Table 1. Number of papers with incorrect and correct authors and their percentages for fish species with author in the papers titled in Cumhuriyet Dönemi Su Ürünleri Bibliyografisi book

Scientific name	Correct authority	Numbers of citations	
		Incorrect n. (%)	Correct n. (%)
<i>Acanthobrama marmid</i>	Heckel, 1843	4 (66.67)	2 (33.33)
